## **Criteria for Roof Underlayment Alternatives**

TDI compiles a list of acceptable underlayment alternatives that do not align with the current building codes (2018 IRC and IBC) and the referenced standards. These alternative products are selected based on established standards such as AC48, AC160, AC188, or other evaluation and testing reports. Products that comply with ASTM D226, ASTM D1970, ASTM D4869, or ASTM D6757 criteria are considered acceptable under existing building codes and therefore are excluded from this list.
